

AMENDMENTS TO THE SPECIFICATION

Please replace the following paragraph beginning on page 18, line 22 as follows:

According to a fourth aspect of the invention, this relates to a storage medium for digital information, which can be read by a computer system. The storage medium contains a computer program which comprises instructions for causing a processor to determine, in response to the receipt of information which contains at least one position on an imaginary surface, to which region on the imaginary surface the position or positions belong, and to determine from the region affiliation how the information is to be managed. In other words, a computer-readable medium encoded with a computer program includes instructions for causing a computer to determine, in response to the receipt of information which contains at least one position on an imaginary surface, to which region on the imaginary surface the position or positions belong, and to determine from the region affiliation how the information is to be managed.
